Nama: Victor Asido Tambunan Matkul: Pemrogramman Jaringan

NPM : 51421502 Kelas : 4IA10

Tema : Socket Programming

Socket File Tranfer

Program ini merupakan implementasi dari konsep **socket programming** menggunakan bahasa Python, yang bertujuan untuk membangun aplikasi **client-server** yang mampu melakukan **pengiriman dan penerimaan file** secara langsung melalui jaringan. Program mendukung pengiriman beberapa file sekaligus, menampilkan progress bar saat transfer, serta mencatat log aktivitas untuk keperluan dokumentasi atau debugging.

Kerangka Program

Socket Programming

(Hanya fileserver dan client yang utama)

Program

fileserver.py

```
import socket
import threading
import os
PORT = 5050
SERVER = socket.gethostbyname(socket.gethostname())
ADDR = (SERVER, PORT)
CHUNKSIZE = 4096
SEPARATOR = "<SEPARATOR>"
LOGFILE = "server_log.txt"
def log_event(message):
  with open(LOGFILE, "a") as log:
        log.write(f"[{datetime.now()}] {message}\n")
def handle_client(conn, addr):
    print(f"[NEW CONNECTION] {addr}")
        cmd = conn.recv(1024).decode().strip()
        if cmd == "SEND":
            conn.send("OK".encode())
            filenames = conn.recv(1024).decode().strip().split(SEPARATOR)
             for _ in filenames:
                header = conn.recv(1024).decode()
                filename, filesize = header.split(SEPARATOR)
                filesize = int(filesize)
                 with open(os.path.basename(filename), "wb") as f:
                    bytes read = 0
                    while bytes_read < filesize:
                        chunk = conn.recv(min(CHUNKSIZE, filesize - bytes_read))
                        if not chunk:
                            break
                        f.write(chunk)
                        bytes_read += len(chunk)
                log_event(f"Received file: {filename} from {addr}")
        elif cmd == "RECEIVE":
            conn.send("OK".encode())
            filenames = conn.recv(1024).decode().strip().split(SEPARATOR)
            for filename in filenames:
                if os.path.exists(filename):
                    filesize = os.path.getsize(filename)
                    {\tt conn.send(f"\{filename\}\{SEPARATOR\}\{filesize\}".encode())}}
                    with open(filename, "rb") as f:
while (chunk := f.read(CHUNKSIZE)):
                            conn.sendall(chunk)
                    log_event(f"Sent file: {filename} to {addr}")
                    conn.send(f"ERROR: File {filename} not found.".encode())
        conn.close()
   server = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
   server.bind(ADDR)
   server.listen()
     print(f"[LISTENING] Server listening on {SERVER}:{PORT}")
        conn, addr = server.accept()
         threading.Thread(target=handle_client, args=(conn, addr)).start()
 if __name__ == "__main__":
     start_server()
```

• Bertindak sebagai server yang selalu aktif menerima koneksi dari client.

- Menggunakan socket TCP (SOCK_STREAM) untuk koneksi yang andal.
- Dapat menerima beberapa file dari client atau mengirim file yang diminta client.
- Mencatat aktivitas seperti file yang diterima/dikirim ke dalam file server_log.txt.
- Menggunakan multithreading untuk melayani banyak client secara bersamaan.

fileclient.py

```
client > 🍦 fileclient.py >
      import socket
      from tqdm import tqdm
      from datetime import datetime
      PORT = 5050
      SERVER = socket.gethostbyname(socket.gethostname())
     ADDR = (SERVER, PORT)
     CHUNKSIZE = 4096
     SEPARATOR = "<SEPARATOR>"
      LOGFILE = "client_log.txt"
      def log_event(message):
          with open(LOGFILE, "a") as log:
              log.write(f"[{datetime.now()}] {message}\n")
      Windsurf: Refactor | Explain | Generate Docstring | × def send_files(filenames):
          with socket.socket(socket.AF_INET, socket.SOCK_STREAM) as client:
             client.connect(ADDR)
              client.send(b"SEND")
              if client.recv(1024).decode().strip() == "OK":
                  client.send(SEPARATOR.join(filenames).encode())
                   for filename in filenames:
                       if os.path.exists(filename):
                           filesize = os.path.getsize(filename)
                           client.send(f"{filename}{SEPARATOR}{filesize}".encode())
                          with open(filename, "rb") as f, tqdm(total=filesize, unit='B', unit_scale=True,
                          desc=filename) as progress:
                              while (chunk := f.read(CHUNKSIZE)):
                                  client.sendall(chunk)
                                  progress.update(len(chunk))
                          log_event(f"Sent file: {filename}")
                          print(f"File not found: {filename}")
     def receive_files(filenames):
         with socket.socket(socket.AF_INET, socket.SOCK_STREAM) as client:

                break
              print("Pilihan tidak valid. Coba lagi.")
79 v if __name__ == "__main__":
        menu()
        print("Program selesai.")
```

- Bertindak sebagai client dengan menu CLI interaktif.
- User dapat memilih untuk mengirim file, menerima file, atau keluar.
- Mendukung pengiriman dan penerimaan multiple file sekaligus (dipisahkan dengan koma).
- Menampilkan progress bar saat transfer file menggunakan modul tqdm.
- Mencatat aktivitas seperti file yang dikirim/didownload ke dalam client_log.txt.

Cara Kerja

- 1. Jalankan server (fileserver.py) terlebih dahulu.
- 2. Jalankan client (fileclient.py) di jendela terminal lain.
- 3. Di sisi client, user akan memilih aksi:
 - o Kirim file: Client mengirim nama file dan isi file ke server.
 - o **Terima file**: Client meminta file yang tersedia di server.
- 4. Server merespons sesuai perintah dan mencatat log-nya.
- 5. File akan dikirim/diterima secara berurutan dengan progress bar.

Output

Fileserver.py

```
PS C:\Users\victo\OneDrive\Desktop\Victor\server> python fileserver.py
[LISTENING] Server listening on 192.168.56.1:5050
```

Aktivasi server yang menerima request

Fileclient.py

```
PS C:\Users\victo\OneDrive\Desktop\Victor\client> python fileclient.py

1. Kirim file ke server
2. Ambil file dari server
3. Keluar
Pilih opsi (1/2/3): 2
Masukkan nama file yang ingin diunduh (pisahkan dengan koma): test.docx,test.txt
test.docx: 100% 13.2k/13.2k [00:00<00:00, 13.2MB/s]
ERROR: File test.txt not found.
```

Mengambil file dari server test.docx

Before:

After:

File test.docx berpindah ke client

```
1. Kirim file ke server
2. Ambil file dari server
3. Keluar
Pilih opsi (1/2/3): 1
Masukkan nama file (pisahkan dengan koma): index.html
index.html: 100% 896/896 [00:00<00:00, 32.0kB/s]
```

Mengirim file index.html keserver

Server menerima file index.html

Aktivitas dicatat di:

o server log.txt

```
server > E server_log.txt

1    [2025-05-17 22:44:59.742823] Sent file: test.docx to ('192.168.56.1', 57236)

2    [2025-05-17 22:51:15.625220] Received file: index.html from ('192.168.56.1', 61530)

3    [2025-05-17 22:53:20.479360] Received file: index.html from ('192.168.56.1', 62987)

4
```

client_log.txt

```

```

Kesimpulan

Program ini secara keseluruhan membuktikan keberhasilan penerapan socket programming dalam membuat aplikasi client-server yang mendukung pengiriman dan penerimaan file secara efisien dan andal. Dengan fitur tambahan seperti menu interaktif berbasis CLI, dukungan untuk pengiriman beberapa file sekaligus, progress bar yang memberikan visualisasi proses transfer, serta sistem logging otomatis yang mencatat setiap aktivitas komunikasi, program ini menunjukkan praktik pemrograman jaringan yang tidak hanya fungsional tetapi juga mudah digunakan dan dipelihara. Fitur-fitur tersebut menjadikan aplikasi ini relevan sebagai fondasi untuk sistem transfer file yang lebih kompleks di masa depan, baik dalam skala lokal maupun jaringan yang lebih luas.
